RE: Section 114(a) Request for Information Ferrara Candy Company I.D. No. 031090AAY

Mr. Connelly:

Per our discussion, Ferrara Candy Company, located at 7301 West Harrison Street in Forest Park, Illinois, is providing the following additional information:

 Operating records for process equipment exhausting volatile organic material (VOM emissions to the catalytic oxidizer (oxidizer) for the periods indicated in the December 2015 Section 114 information request.

The operating time of the panning operations that exhaust VOM emissions to the oxidizer are recorded on the oxidizer combustion temperature charts previously provided in the initial January 29, 2016 response to the Section 114 Request for Information. As indicated in the response, when panning operations are being conducted, the oxidizer combustion chamber outlet temperature fluctuates due to the loading of VOM emissions from the panning process. The "Blue Line" on the temperature chart, which indicates combustion chamber outlet temperature, fluctuates above the combustion chamber preset inlet temperature when panning operations are occurring. Therefore, these charts record the day and time that the controlled panning operations are occurring.

2. <u>Internal (e.g., Ferrara performed) oxidizer maintenance records for the periods indicated</u> in the December 2015 Section 114 information request.

Other than minor preventative maintenance activities, Ferrara uses qualified third party vendors to conduct maintenance on the oxidizer on a scheduled semi-annual and annual basis depending upon the type of routine maintenance required. Attachment A includes

U.S. EPA Section 114 Request March 4, 2016 Page 2

the Ferrara oxidizer preventative maintenance logs from October 2013 to December 2015. Typical oxidizer preventative maintenance activities include visually checking the combustion temperature chart and recorder, inspecting panning room enclosures, and checking oxidizer operation. These maintenance procedures are conducted on a daily, weekly, and monthly basis.

3. Combustion chamber operating temperature at which the oxidizer will be operated during the stack testing program.

As discussed on the phone, the required stack testing program is currently scheduled for April 4-5, 2016. During the testing program, the oxidizer will be operated at 550 Degrees Fahrenheit (F). This is the temperature that the oxidizer has been operated for at least the past five years and is 25F above the temperature the oxidizer was last tested at (and required to be operated at per permit requirements).

Should you have any questions, please contact our consultant, Britt Wenzel of Mostardi Platt at (630) 993-2123.

Respectfully Submitted,

Craig Caswell Regulatory Engineer
